Burden

DAILY REGION METRICS

Individual metrics represent trusted data sources. VDH uses an established method to determine the current burden and trend for each metric. These data are then compared to thresholds to calculate an indicator value of 0, 1, or 2. The color of the circles below indicates the indicator value for the burden or trend of that individual metric.

Individual Metrics Burden and Trend, 3/18/2021

BURDEN	TREND
16.6	Decreasing

*Due to lag in testing data reporting, the most recent day with an available 7-day average percent positivity is 3/16/2021. This value is based from 3/16/2021 to present data. A data lag of 4 days (including current dated) will occur on daily basis. This allows for testing results to be reported to ensure a reliable calculation of the percent positivity results.
